

Option 4 — Resume Rewrite

How It Works: Section-by-Section Behaviour

ScoreMyCV Internal Reference • 2026

Overview

Option 4 is a two-step pipeline. Unlike Options 1/2/3 where Gemini generates the entire HTML, Option 4 separates concerns: Gemini only extracts and lightly cleans content into structured JSON, then the server builds the HTML entirely. This ensures consistent layout, clean PDF text layer, and better ATS parsing.

Step 1 — Gemini Extraction (JSON Only)

Gemini 2.5 Flash reads the raw CV text and outputs a structured JSON object. Temperature is set to 0 (no creativity — pure extraction). It never generates HTML or styles.

What Gemini receives:

- Raw CV text (up to 8,000 characters)
- Job role selected by user (e.g. 'Data Analyst')
- ATS keyword injection instruction (up to 15 missing keywords)
- Instruction to copy summary exactly, only fix grammar/verbs

What Gemini outputs (JSON schema):

- name:** Candidate full name — extracted as-is
- designation:** Best job title for the selected role (fallback = job role dropdown)
- summary:** Copied exactly from CV. Only grammar/punctuation/verb fixes. No rewriting.
- skills:** Array of {category, items} — extracted from skills section
- experience:** Array of {company, location, role, dates, bullets[]}
- projects:** Array of {title, tools, date, bullets[]}
- education:** Array of {institution, location, degree, dates, cgpa}
- certifications:** Array of {name, issuer}
- achievements:** Bullets from Achievements / Key Achievements / Awards / Coding Practices
- leadership:** Items from Leadership / Extracurricular / Activities sections

Step 2 — Server Builds HTML (No Gemini)

After JSON is received, the server builds the complete HTML resume. Gemini never touches layout, fonts, or styles. This is why Option 4 is more consistent than Options 1/2/3.

Contact Section

- Phone, email, location: extracted via regex from raw CV text (not Gemini)
- LinkedIn/GitHub URLs: extracted from PDF annotation links or bare domain scan
- If URL found → clickable hyperlink. If text-only mention found → plain text label
- 'Open to Relocate' added only if mentioned in CV or form
- All contact details are server-built — Gemini never sees or modifies them

Profile Summary

- Copied exactly from CV — Gemini only fixes grammar, punctuation, action verbs
- Meaning, order, and facts are never changed
- If no summary in CV → section is omitted entirely

Technical Skills

- Categories and items extracted from CV skills section as-is
- ATS missing keywords (up to 15) are passed to Gemini with instruction to add where relevant
- Gemini can add missing keywords to skills items if they genuinely fit
- Skills section rendered as Bold Category: value pairs

Experience

- Company, location, role, and dates extracted exactly from CV
- Bullet points: lightly improved phrasing for ATS — no fabrication of facts
- Date casing normalized: 'DEC 2024' → 'Dec 2024' automatically
- Rendered as: Company — Location (bold left) | Dates (italic right), Role (italic), then bullets

Projects

- Title, tools, date, and bullet points extracted from CV
- Bullet points: lightly ATS-improved, no new facts added
- GitHub/Dashboard links: injected if URLs were extracted from the PDF or DOCX hyperlinks
- Date casing normalized same as Experience

Education

- Institution, location, degree, dates, CGPA extracted as-is
- No changes made — pure extraction
- Rendered: Institution — Location (bold) | Dates (italic), Degree + CGPA below

Certifications

- Name and issuer extracted from CV
- Rendered as disc bullet list: Cert Name — Issuer
- Credential links injected if URLs were found in the source PDF/DOCX

Achievements

- Extracted from sections named: Achievements, Key Achievements, Awards, Coding Practices
- Section-name prefix stripped automatically (e.g. 'Coding Practices: Solved...' → 'Solved...')
- Rendered as standard bullet list

Leadership & Activities

- Extracted from: Leadership, Extracurricular, Activities sections
- Rendered as: Bold Role: description bullets
- If section not present in CV → omitted entirely

Step 3 — Puppeteer PDF Generation

The server-built HTML is sent to a headless Chromium browser (Puppeteer) which renders it and exports a PDF. This gives pixel-perfect A4 output with embedded fonts and a clean text layer that ATS can parse reliably.

- Page size: A4 portrait (210 x 297 mm)
- Margins: 28px top/bottom, 44px left/right
- Font: Calibri / Arial fallback
- PDF text layer is fully machine-readable — not image-based

ATS Keyword Injection

Before Gemini is called, the server compares the CV text against a hardcoded keyword list for the selected job role. Up to 15 missing keywords are identified and passed as an instruction to Gemini.

- Role keyword list: 60+ roles supported (Data Analyst, ML Engineer, Power BI Developer, etc.)
- Missing keywords passed to Gemini: 'Weave in naturally where truthful and relevant'
- Gemini may add to Skills section, summary, or experience bullets — never invents experience
- Cap of 15 keywords per rewrite to avoid keyword stuffing

What Option 4 Does NOT Do

- Does NOT rewrite or paraphrase the summary (only grammar/verb fixes)
- Does NOT invent experience, metrics, or company names
- Does NOT fabricate project titles or tools
- Does NOT change education details
- Does NOT generate HTML — server does that entirely
- Does NOT add years of experience if not in original CV

Option 4 vs Options 1/2/3

Aspect	Options 1/2/3	Option 4
HTML generation	Gemini generates full HTML	Server generates HTML
Layout consistency	Varies per run	Always identical
Summary handling	Gemini rewrites freely	Copied exactly, verb fix only
ATS text layer	Can have garbled structure	Always clean and parseable
Keyword injection	Same keywords injected	Same keywords injected
Contact handling	Gemini may corrupt links	Server extracts, never corrupts
Speed	Similar	Similar
ATS score	Can vary	More consistent, slightly better
